

*Track Guards protect rollers and links from damage and deformation. They are designed primarily for use in high-impact underfoot conditions. They keep out large rock and material preventing the overload to undercarriage to reduce wear and damage*

*ITR recommends track guards only when the excavator is being used in rocky working conditions (not in normal working conditions) as they are specifically designed for this.*

*The track guards are fabricated using Q435/Q235 material and can be customised as per the plate thickness requested by customer depending on the application. ITR can provide both "Weld On" and "Bolt On" types.*

*ITR has in range the track guards for upto 40 tonnage class of all the popular excavator models of Komatsu, Hitachi, Caterpillar, Hyundai , Sumitomo, Kobelco, Daewoo-Doosan, Volvo and others..*
